

Truthy and Falsy values

1. Number 0 is false
2. String "0" is false.
3. An empty string is false.
4. Undefined is false.
5. NaN is false.
6. Null is false.
7. Whitespace in a string is true.
8. Empty array and object is true.
9. False in string is true.

Undefined vs Null

Getting undefined:

1. If value not set.
2. When a function doesn't return anything.
3. If any parameter not passed.
4. If any property that is not set in an object is tried to be accessed is return undefined.
5. It is false.

Getting null:

1. You have to set Null explicitly.

Double vs Triple equal

1. Double equal just check value where triple equal check type and value.
2. Using triple equal is preferred.
